Calcium Chloride

Calcium chloride is used in wastewater treatment applications to remove unwanted impurities. Applied to oily wastewater, it can cause oil droplets to float to the surface where they can be skimmed off. It forms highly insoluble salts with fluorides, silicates, phosphates, sulphates & heavy metal contaminants in the water. These can then be flocculated & removed from the wastewater.

Packaging: *20kg & 25kg bags*

Calcium Chloride Solution

Calcium chloride is used in wastewater treatment applications & as a water hardening agent. It aids in water clarification by removing contaminants through precipitation with fluorides & phosphates as well as maintaining the balance of ions as a water hardener.

Available in 10% & 30% concentrations.

Packaging: *20L & 1000L IBC*
